Sustainability has emerged as a potentially unifying paradigm for work that simultaneously fosters human and planetary well-being. Students study the historical origins, theoretical frameworks, and tools associated with the three-legged view (economy, environment, society) of current sustainability policies and practices, and use case study methodologies to analyze and evaluate how sustainability policies and practices are being designed and implemented in a variety of organizations and communities. Students conduct an experiential exploration of the personal and spiritual dimensions of sustainability practice. Required for MA Resilient Leadership students (both tracks).

Course Number: ENV710
Unit: 3.0
Program: Environmental Studies
